Worksheet No.: 6

Student Name: Harsh
UID: 24MCA20045
Branch: MCA (General)
Section/Group: 1-A
Semester: 2nd
Date of Performance : 08/04/2025
Subject Name: Advanced internet programming lab
Subject Code: 24CAP-652

1. Aim of the practical:

Create and consume Restful web services for accessing employee data application securely.

2. Apparatus:

Visual Studio code (Vs code), Mongodb, Postman.

3. Code for experiment/practical:

```
// Import required modules
const express = require('express');
const mongoose = require('mongoose');
const bodyParser = require('body-parser');
const jwt = require('jsonwebtoken');
const bcrypt = require('bcryptjs');
const dotenv = require('dotenv');
const cors = require('cors');

dotenv.config();

// Initialize express app
const app = express();

// Use middlewares
app.use(bodyParser.json());
```

```
app.use(cors());

// MongoDB Connection
mongoose.connect('mongodb://localhost:27017/Employee', { useNewUrlParser: true,
useUnifiedTopology: true })
  .then(() => console.log('MongoDB connected'))
  .catch((err) => console.log(err));

// Employee Schema
const employeeSchema = new mongoose.Schema({
  name: { type: String, required: true },
  position: { type: String, required: true },
  salary: { type: Number, required: true },
});

const Employee = mongoose.model('Employee', employeeSchema);

// User Schema for Authentication
const userSchema = new mongoose.Schema({
  username: { type: String, required: true },
  password: { type: String, required: true },
});

const User = mongoose.model('User', userSchema);

// Register a new user (Admin)
app.post('/register', async (req, res) => {
  const { username, password } = req.body;
  const hashedPassword = await bcrypt.hash(password, 10);
  const newUser = new User({ username, password: hashedPassword });

  try {
    await newUser.save();
    res.status(201).json({ message: 'User created' });
  } catch (error) {
    res.status(400).json({ error: error.message });
  }
});

// Login to get a JWT token
```

```
app.post('/login', async (req, res) => {
  const { username, password } = req.body;

  const user = await User.findOne({ username });
  if (!user) return res.status(400).json({ message: 'Invalid credentials' });

  const isPasswordValid = await bcrypt.compare(password, user.password);
  if (!isPasswordValid) return res.status(400).json({ message: 'Invalid credentials' });

  const token = jwt.sign({ userId: user._id, username: user.username }, 'MasterApp', { expiresIn:
'1h' });
  res.json({ token });
});

// Middleware to authenticate JWT token
const authenticate = (req, res, next) => {
  const token = req.header('Authorization')?.replace('Bearer ', '');
  if (!token) return res.status(401).json({ message: 'Authentication required' });

  try {
    const decoded = jwt.verify(token, 'MasterApp');
    req.user = decoded;
    next();
  } catch (error) {
    res.status(401).json({ message: 'Invalid token' });
  }
};

// CRUD operations for Employees

// Create a new employee
app.post('/employees', authenticate, async (req, res) => {
  const { name, position, salary } = req.body;
  const newEmployee = new Employee({ name, position, salary });

  try {
    const savedEmployee = await newEmployee.save();
    res.status(201).json(savedEmployee);
  } catch (error) {
    res.status(400).json({ error: error.message });
```

```
  }
});

// Get all employees
app.get('/employees', authenticate, async (req, res) => {
  try {
    const employees = await Employee.find();
    res.status(200).json(employees);
  } catch (error) {
    res.status(400).json({ error: error.message });
  }
});

// Get employee by ID
app.get('/employees/:id', authenticate, async (req, res) => {
  try {
    const employee = await Employee.findById(req.params.id);
    if (!employee) return res.status(404).json({ message: 'Employee not found' });
    res.status(200).json(employee);
  } catch (error) {
    res.status(400).json({ error: error.message });
  }
});

// Update an employee by ID
app.put('/employees/:id', authenticate, async (req, res) => {
  const { name, position, salary } = req.body;
  try {
    const updatedEmployee = await Employee.findByIdAndUpdate(
      req.params.id,
      { name, position, salary },
      { new: true }
    );
    res.status(200).json(updatedEmployee);
  } catch (error) {
    res.status(400).json({ error: error.message });
  }
});

// Delete an employee by ID
```

```
app.delete('/employees/:id', authenticate, async (req, res) => {
  try {
    await Employee.findByIdAndDelete(req.params.id);
    res.status(200).json({ message: 'Employee deleted' });
  } catch (error) {
    res.status(400).json({ error: error.message });
  }
});

// Start the server
const PORT = 3000;
app.listen(PORT, () => {
  console.log(`Server running on http://localhost:${PORT}`);
});
```

5. Learning outcomes (What I have learnt):

1. Understanding CRUD: Learn to perform Create, Read, Update, and Delete operations in Node.js with MongoDB.
2. Setup Node.js & MongoDB: Configure a Node.js server with Express and connect it to MongoDB using Mongoose.
3. Build RESTful APIs: Implement APIs for CRUD operations and test them using Postman.

4. Handle API Requests: Work with HTTP methods (GET, POST, PUT, DELETE) and manage request data.
5. Validate & Manage Data: Use Mongoose schemas for data validation and error handling in MongoDB.

Evalution Grid:

Sr. No.	Parameters	Marks Obtained	Maximum Marks
1.	Worksheet		8 Marks
2.	Viva		10 Marks
3.	Simulation		12 Marks
	Total		30 Marks
